Great Plains Streamflow Duration Assessment Method

General site information

Project name or number:

Site code or identifier:

Assessor(s):

Waterway name:

Visit date:

Current weather conditions (check one):
□ Storm/heavy rain
□ Steady rain
□ Intermittent rain
□ Snowing
□ Cloudy (_____ % cover)
□ Clear/sunny

Notes on current or recent weather conditions (e.g., precipitation in prior week):

Coordinates at downstream end (decimal degrees):

Lat (N):

Long (E):

Datum:

Surrounding land-use within 100 m (check one or two):
□ Urban/industrial/residential
□ Agricultural (farmland, crops, vineyards, pasture)
□ Developed open-space (e.g., golf course)
□ Forested
□ Other natural
□ Other:

Describe reach boundaries:

Mean bankfull channel width (m): _____
(Indicator 1)

_____ _____ _____

Reach length (m):
40x width
min 40 m
max 200 m

Site photographs:
Enter photo ID or check if completed.

Top down: _____ Mid down: _____

Mid up: _____ Bottom up: _____

Disturbed or difficult conditions (check all that apply):
□ Recent flood or debris flow
□ Stream modifications (e.g., channelization)
□ Diversions
□ Discharges
□ Drought
□ Vegetation removal/limitations
□ Other (explain in notes)
□ None

Notes on disturbances or difficult site conditions:

Observed hydrology:

_____ % of reach with surface flow

_____ % of reach with sub-surface or surface flow

_____ # of isolated pools

Comments on observed hydrology:

Site sketch:

1. Mean bankfull channel width (m) (nearest 0.1 m, copy from first page of field form)

Notes about mean bankfull channel width:

2. Total aquatic macroinvertebrate abundance

Collect aquatic macroinvertebrates from at least 6 locations in the assessment reach and determine total abundance using the following categories:

Mark the appropriate box for the total number of aquatic macroinvertebrates observed.

- ☐ Total abundance of aquatic macroinvertebrates is zero.
- ☐ Total abundance is ≥1 and <10.
- ☐ Total abundance is ≥10.

Notes on total aquatic macroinvertebrate abundance:

3. Number of hydrophytic plant species

Record up to 3 hydrophytic plant species (FACW or OBL in the appropriate regional wetland plant list, depending on location) within the assessment area: **within the channel or up to one half-channel width outside the channel**. Explain in notes if species has an odd distribution (e.g., one individual or small patch, long-lived species solely represented by seedlings, or long-lived species solely represented by specimens in decline), or if there is uncertainty about the identification. Enter photo ID or check if photo is taken.

_____ Number of hydrophytic plant species identified from the assessment reach without odd distribution. Enter zero if none were found.

Check if applicable: ☐ No vegetation in assessment area

Species	Odd distribution?	Notes	Photo ID

Notes on hydrophytic vegetation:

4. Presence/absence of rooted upland plants in streambed

Evaluate the reach for rooted upland plants (i.e., plants rated as FAC, FACU, UPL, NI, or not listed in regionally appropriate regional National Wetland Plant List) in the streambed.

Mark the appropriate box for rooted upland plants.

☐ Rooted upland plant individuals are present in the streambed.

☐ Rooted upland plant individuals are absent in the streambed.

Upland species	Notes	Photo ID

Notes on presence/absence of rooted upland plants in streambed**:**

5. Differences in vegetation

____ (0-3) *Half scores (0.5, 1.5, 2.5) are allowed.*	Compare the composition and density of plants growing on the banks and riparian areas to plants in the adjacent uplands. For this indicator, upland vegetation is not defined by its wetland indicator status but by its location relative to the channel. 0 (Poor) No compositional or density differences in vegetation are present between the streambanks and adjacent uplands. 1 (Weak) Vegetation growing along the reach may occur in greater densities or grow more vigorously than vegetation in the adjacent uplands, but there are no dramatic compositional differences between the two. 2 (Moderate) A distinct riparian vegetation corridor exists along part of the reach. Riparian vegetation is interspersed with upland vegetation along the length of the reach. 3 (Strong) Dramatic compositional differences in vegetation are present between the stream banks and adjacent uplands. A distinct riparian corridor exists along the entire reach. Riparian, aquatic, or wetland species dominate the length of the reach.
Notes on differences in vegetation:	

6. Riffle-pool sequence

____ (0-3) *Half scores (0.5, 1.5, 2.5) are allowed.*	Evaluate the prevalence of riffles, pools, and other microhabitats in the streambed. 0 (Poor) No riffle-pool sequences observed. 1 (Weak) Mostly has areas of pools or riffles. 2 (Moderate) Represented by a less frequent number of riffles and pools. Distinguishing the transition between riffles and pools is difficult to observe. 3 (Strong) Demonstrated by a frequent number of structural transitions (e.g., riffles followed by pools) along the entire reach. There is an obvious transition between riffles and pools.
Notes about riffle-pool sequence:	

7. Particle size or stream substrate sorting

____ (0-3) *Half-scores (0.75, 2.25) are allowed.*	Evaluate the extent of substrate sorting. Compare substrate on the channel bed to the banks and adjacent floodplain. Look for sorting within the channel bed (e.g., along bars and islands). 0 (Poor) Particle sizes in the channel are similar or comparable to particle sizes in areas close to but not in the channel. Substrate sorting is not readily observed in the channel. 1.5 (Moderate) Particle sizes in the channel are moderately similar to particle sizes in areas close to but not in the channel. Various sized substrates are present in the channel and are represented by a higher ratio of larger particles (gravel/cobble). 3 (Strong) Particle sizes in the channel are noticeably different from particle sizes in areas close to but not in the channel. There is a clear distribution of various sized substrates in the channel with finer particles accumulating in the pools, and larger particles accumulating in the riffles/runs.
Notes about substrate sorting:	

8. Sediment on plants or debris

____ (0-1.5) *Half scores (0.25, 0.75, 1.25) are allowed.*	Evaluate the extent of fine sediment on plants or debris within the stream channel, streambank, and floodplain. 0 (Poor) No fine sediment is present on plants or debris. 0.5 (Weak) Fine sediment is isolated in small amounts along the stream. 1 (Moderate) Fine sediment found on plants or debris within the stream channel, although it is not prevalent along the stream. Mostly accumulating in pools. 1.5 (Strong) Fine sediment found readily on plants and debris within the stream channel, on the streambank, and within the floodplain throughout the length of the stream.
Notes about sediment on plants or debris:	

Photo log

Indicate if any other photographs taken during the assessment:

Photo ID	Description

Additional notes about the assessment:

Model classification:

☐ Ephemeral

☐ At least intermittent

☐ Intermittent

☐ Less than perennial

☐ Perennial

☐ Needs more information
